

# Why Digital Tactical Worksheet (DTW)

Digital Tactical Worksheet (DTW) is a browser-based incident command and accountability tool designed to support real-time strategy, resource tracking, and situational awareness for the fire service.

## The Problem

Incident command relies on clarity, accountability, and decision-making under stress. Many departments still depend on paper tactical worksheets and whiteboards that are difficult to update, hard to share, and poorly suited for tablets or modern training environments.

## The Solution

DTW replaces paper worksheets with a live, interactive command board that works on desktops, laptops, and tablets with no installation, no logins, and no CAD dependency.

## Why DTW is Different

DTW is built around how command officers actually operate. It supports unit-based accountability, benchmarks, notes tied directly to resources, and multiple operational boards for staging, planning, and accountability. It is intentionally simple, fast to learn, and flexible for both live incidents and training.

## What DTW Replaces

DTW is designed to replace or supplement paper ICS tactical worksheets, whiteboards, static training diagrams, and ad-hoc accountability tracking. It complements existing CAD and dispatch systems rather than replacing them.

## Licensing

DTW is licensed per department with unlimited users and devices under a single annual license. This keeps administration simple and predictable for agencies of any size.
